

Prixm Racing Analyzer

Daily Workflow Guide

Morning — Before Racing

Step 1: Fetch Today's Racecards

Open a terminal in your BB Analyzer folder and run:

```
python racecard_fetcher.py
```

This scrapes Racing Post for all UK/IRE racecards, scores every runner, and saves to daily_race_data.json. Takes 1-3 minutes depending on the number of races.

Step 2: Open the Interface

Open daily_racing_analyzer.html in your browser. The interface loads the race data automatically.

Step 3: Review the Day

Check the following sections:

- Prixm Picks of the Day — quality-gated selections (NAP / WIN / STRONG / PLACE)
 - Race Cards — browse by venue, field size, or combo filter
 - Deep Dive — click any race card for full analysis, head-to-head, and betting signal
 - Confidence Threshold — the composite score cutoff where placed rate is highest
-

Evening — After All Races Finish

Step 4: Fetch Results

Double-click Fetch Results.bat in your BB Analyzer folder.

This scrapes Racing Post results for every race, matches them to your race data (attaching predicted scores), and saves to results_history.json + results_history.js. The terminal window stays open so you can see progress.

Step 5: Refresh the Interface

Refresh the browser page. All race cards should now show green LOGGED badges. Performance stats, combo tracking, and calibration data all update automatically.

Optional — Performance Tuning

Calibrate Weights (when surface reaches 250+ races)

In the Performance tab, click Calibrate Now on any surface that shows Ready. This adjusts how much each scoring factor (form, rating, trainer, etc.) contributes to the composite score for that surface type.

Run Threshold Optimizer (after logging 50+ results)

Click Run Calibration on the Confidence Threshold Optimizer. This finds the composite score cutoff where your placed rate is highest — use it as your bet/skip line.

Check the Calendar

The Performance tab calendar shows your daily Win% and Place% colour-coded by month. Use it to track engine accuracy over time.

File Reference

File	Purpose
<code>daily_racing_analyzer.html</code>	Main interface — open in browser
<code>racecard_fetcher.py</code>	Morning script — fetches racecards from RP
<code>Fetch Results.bat</code>	Evening script — fetches results + generates JS
<code>results_fetcher.py</code>	Backend for <code>Fetch Results.bat</code>
<code>daily_race_data.json</code>	Today's race data (auto-generated)
<code>results_history.json</code>	All logged results (cumulative)
<code>results_history.js</code>	JS version for <code>file://</code> loading (auto-generated)
<code>calibration_engine.py</code>	Weight calibration backend
<code>race_data/</code>	Archive of daily race JSONs by date

Quick Summary

When	Action	How
Morning	Fetch racecards	<code>python racecard_fetcher.py</code>
Morning	Review picks	Open HTML in browser
Evening	Log results	Double-click <code>Fetch Results.bat</code>
Evening	Check performance	Refresh browser
Weekly	Calibrate weights	Performance tab → Calibrate Now
Weekly	Update threshold	Performance tab → Run Calibration
